CAPUT TRIGESIMUM XXXVI. HOOFDSTUK.
SEX TUM.

Perticaria tertia. Hunut.

De Stange-Boom.

Perticaria tertia crassum, sed non altum, gerit trun-
cum, albo glabroque cortice obductum, quo a
cæteris distinguitur, & dignoscuntur arboribus, at-
que in binas subdividitur species, latifoliam & parvifoli-
lam, quæ utraque unam eandemque habent for-
mam, excepto quod magnitudine differant.

Hunut parvifolia vulgatissima est, paucos gerens si-
nuos & breves ramos: Hujus folia solitaria sunt, for-
mam habentia potissimum perticariæ primæ, sed latio-
ra sunt, nec mollia aut lanuginosa instar illius, sed ru-
gosæ admodum & scabra, ut & petiolæ superiores ra-
muli, unde & quodammodo spinulosa & arenosa vi-
dentur, ad oras subtiliter serrata sunt, ac porro sic-
cissima, injuncundi adspectus, & sonora.

Folia hæc inæqualis sunt magnitudinis, atque in-
ordinata ramis insident, quædam enim spithamam longa
sunt, ac sex digitos lata, quædam quinque & sex
polices longa, vix quatuor lata, inferius subrotunda,
ac sinuosa prope petiolum, ubi tres magni nervi
concurrunt cum aliis costis transversalibus & venulis,
a quibus folium rugosum est.

Flores in ample extensis racemis excrescent, qui
singularis sunt formæ, compositi enim sunt ex decem
angustis aureis petalis, instar stellæ expansis, in quo-
rum medio alia quædam minoræ petala locantur cir-
cinnata, aureum referentes auris ornamentum, quod
ex mulierum auribus dependet. Fructus magnitudinem
Cerasi nigri habet, substantia lenta, atque in
quinque ejus cellulis totidem locantur tenuia, oblonga,
& incurva semina, quorum anguli acuti sunt, matu-
rescent autem Octobri & Novembri, floresque pro-
ducunt sub finem pluviosorum mensium. Fructus ve-
ro ipsi sunt pentagoni instar Catti-Marus, ac si ex quin-
que alis seu cellulis essent compositi, coloris fumei,
& leves.

Arboris lignum levissimum, mollissimum, & inuti-
lissimum est omnium lignorum, licet crassis constet
fibris, & crassum sit, ad oras silvarum crescit hæc ar-
bor ubique, tam in planicie, quam in montibus, plu-
rimum vero in arenosis & sterilibus locis.

Latifolia præcedenti similis est forma, ejus vero
truncus altior est, atque folia plerumque spithamam
longa sunt, quinque & sex polices lata, eodem modo
serrata & venosa, multo autem rugosiora sunt, nec
tantum arenosa, sed etiam pungentibus pilis hirta,
præsertim petioli & rami, ita ut difficulter tractari pos-
sint, atque pruritum excitent. Fructus eandem ge-
runt formam cum prioribus, sed sunt oblongiores, di-
giti articulum longi: Ejus lignum magis albcat, mol-
lius est, & fragilis quam præcedentis, nec durabile.

Ambæ arbores corticem gerunt glabrum & album,
quo ab aliis facile dignoscuntur arboribus, quique
lentus est uti Restiarie.

Nomen. Latine Perticaria tertia, quum tertia sit
ordine & virtute, a vulgo vocatur Malaice Caju totar-
ra, uti præcedens, verum autem nomen Amboinense
est Hunut.

Ujus. Parvifolia vulgares præbet palos, ad opera
vero, quæ per aliquot tempus durabilia esse oportet,
non vel raro adhibetur, latifolia nullum subministrat
tignum, sed foco utile est ejus lignum.

Tabula Centesima Vigesima

Ramum exhibet Perticarie.

De Hondert en twintigste Plaat
