XXII. *Flos mali.*

Pilosam hanc & flavam lineis obliquis rotundis exornatam crucam in malo deprehendi, caput habebat fuscum, ac retrò illud cærulea duo, ac quolibet in membro duo rosea coralliola, eodem colore tincti fuere pediculi, utrumque latus fuscis pilorum fasciculis protuberavit, in Julii principio deponerat exuvias, telam perforatam texebat flavam piscium reti similem, & in aureliam hepatici coloris immutabatur, per totum corpus pilorum fasciculis obsitam, ac inferiùs in apice nodulo signatam, tacta tam violento motu agitabatur, ut diversis vicibus fursùm deorsùmque volveretur, quatuordecim diebus elapsis inde nigricans albicansque phalænula prodiit, rubicunda duo cornula lata protendens, pennigera, & retrò caput inter cornula rubram gestans lineam, celer erat, vespere volitans.

XXIII. *Vitis florens.*

AMbæ prægrandes hæ crucæ sunt ejusdem generis, colore solummodò differentes, superior enim fusco, sed inferior viridi colore tincta est, utraque punctis lineisque nigris & albis exornatur, de vite pabulum sumunt, pascentes, quiescentibus tertiariorum longiores amplè extenduntur, harum excrementa ex obscuro viridia quinque formant angulos, anguli tamen rotundi bacellulos in fasciculum compositos repræsentant, quemadmodùm pro faciliori intelligentiâ inferiori crucæ appicta conspiciunt.

Ex animadverso jam habui, viridium erucarum aliquas humi Stratas, in sese compendiosissimè convolutas fuisse, unde paulò post sex acari prodierunt, hi mutabantur in fusca doliola, exindè verò ex obscuro cæruleæ lineis nigris virgatæ muscæ fuerunt eductæ, oculos habentes rubicundos, alasque vitri more perspicuas.

Eruca fusca in medio Julii fuscam in aureliam immutabatur ac ità transfigurata in sequentis anni mensẽ usque majum permansit, ubi formosa phalæna prodiit, cujus caput, corpus, ac alæ superiores eleganti roseo colore tinctæ, lineis maculisque,

psit-
